                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is given in a specification relating to nucleic acid vaccines containing genes to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia Sp., Anaplasma Sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The vaccine comprises the major antigenic protein 1 (MAP1) gene or the major antigenic protein 2 (MAP2) gene of rickettsial pathogens. The nucleic acid vaccines can be faiven by the human cytromegalovirus (HGWV) enhancer-promoter. Cowdria ruminatium genes designated map 2, lhworf3, 4hworf1, 18hwoff1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                               Ehrlichia chaffeensis; MAP1; major antigenic protein 1; antirickettsial; vaccine; gene therapy; Rickettsia; Cowdria; Anaplasma; map2; Ihworf3; 4hworf1; 18hworf1; 3gdorf3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Barbet AF, Bowie MV, Ganta RR, Burridge MJ, Mahan SM, McGuire TC;

The patent relates to homologous 28-kiloDalton (kDa) protein genes of Ehrlichia canis, designated ECa28SA1, ECa28SA2, ECa28SA3, ECa28-1 and ECa28-2. These genes are members of a polymorphic multiple gene family and contained in a single locus of 5.592 kb. The 28-kDa proteins are immunoreactive with anti-E. canis serum hence are important immunoprotective antigens. The protein is useful for vaccinating against E. canis infections such as canine ehrlichiosis in dogs. Canine ehrlichiosis, also known as canine tropical pancytopaenia, is a tick-borne rickettsial disease of dogs. ECa28-1 is conserved amongst different strains of E. canis and hence useful for serodiagnosis of canine ehrlichiosis. The present sequence is a E. canis ECa28SA3 30-kDa protein which is post-translationally modified to a
of the OMP family and consist of proteins OMP-1, -1(B to 2) shown in AAVO6943-95B. The E. canis proteins form part of the P30 family and consist of proteins shown in AAVO6959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homologous 28-kDa protein gene; ECa28SA3; immunoreactive; vaccine; p28 gene; p01% gene; po1,morphic multiple gene family; immunoprotective antigen; antibacterial; canine ehrlichiosis; canine tropical pancytopaenia; tick-borne rickettsial disease; serodiagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ehrlichia canis antigens useful for vaccinating against canine ehrlichiosis in dogs
                                                                                                                                                      Length 280;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                               The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1. -1(8 Lo 2) shown in AAV06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAV06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. Sequence 2, Application US/08991942

Sequence 2, Application US/08991942

Patent No. 6015673

GENERAL INCEMATION

GENERAL INCORMATION

APPLICANT: FERNANDEZ-SALGUERO, PEGTO

TITLE OF INVENTION: CLONING AND EXPRESSION OF CDNA FOR HUMAN

TITLE OF INVENTION: CLONING AND EXPRESSION OF CONR FOR HUMAN

TITLE OF INVENTION: CLONING AND EXPRESSION OF CONR FOR HUMAN

TITLE OF INVENTION: DIPTORPREDIATE DEHYDROGENASE

NUMBER OF SEQUENCES: 13

CORRESPONDENCE ADDRESS:

ADDRESSE: Townsend and Townsend Khourie and Crew

STRRET: Steuart Street Tower, One Market Plaza

CITY: San Francisco

STREE: California

COUNTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: BLOPPY disk

COMPUTER: PALOS-NAS-DOS

SORFWARPE: POSS-NAS-DOS

SORFWARPE: POSS-NAS-DOS-NAS-DOS

SORFWARPE: POSS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NAS-DOS-NA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   36.8%; Score 40.5; DB 2; Length 1025; 42.9%; Pred. Patent No. 6232448

GENERAL INFORMATION:
APPLICANT: Yoshikubo, Takashi
APPLICANT: Hasegawa, Masami
TITLE OF INVENTION: Inmunological Materials and Methods for Detecting
TITLE OF INVENTION: Inmunological Materials and Methods for Detecting
TITLE OF INVENTION: Dihydropyrimidine Dehydrogenase
FILE REFERENCE: 09/138,103 Yoshikubo, et al.
CURRENT FILING DATE: 1998-08-138,103A

CURRENT FILING DATE: 1998-08-22

BARLIER TILING DATE: 1997-08-22

NUMBER OF SEQ ID NOS: 8

SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 1025;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 4, Application PC/TUS9504567

                                                                                                                                                                                          ó
The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafebensis and E. canis. The E. chafebensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to 2) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAY06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides isolated outer membrane proteins (OMP) from Entlinia chafeensis and E. canis. The E. chafeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAY06959-970. The proteins and genes are used to detect E. chafeensis in patients and E. canis in dogs.

This is the full-length variable surface antigen VSA4 protein of Bhrilchia draffeensis. Its amino acid sequence was deduced from a partial open reading frame (ORF4) of a genomic locus (see AAV07179) of E. chaffeensis that was obtained on the basis of homology to the major antigence protein MAP1 (see AAW51088) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar, but non-identical proteins (see AAW51091-95). A claimed composition comprises a nucleic acid (see AAW071076-82) encoding a polypeptide (see AAW51088-99) that elicits a protective immune response against rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia. Britichia, Anaplasma and Cowdria species. The Birlichia antigenic associated with Ehrlichia Infection (claimed).

                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence shows a high degree of similarity to the major antigenic protein 1 (MAP1) of Ehrlichia sp. The MAP1 gene may be used in a vaccines to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCMV) enhancer-promoter. Cowdria rumhnatium genes designated map 2, Ihworf3, 4hworf1, 18hworf1 and 3doorf3 may be used in therapeutic and disgnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                   New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                   McGuire TC;

                                                                                                                                                                                                                                                                                                     antigen 4 (YSA4) isolated from Ehrlichia chaffeensis, which has similarity to major antigen protein (MAP). The MAP polynuclectides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynuclectides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is

                                                                                                                                                                                                                   ó
                                                                                                                The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafebensis and E. canis. The E. Chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to 2) shown in AAYO6943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAYO6959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Composition containing nucleic acid encoding rickettsial antigen - useful for, e.g. stimulating protective immune response in humans or animals

This is the near full-length variable surface antigen VSA5 protein of Ehrlichia chaffeensis; it lacks about 5-7 C-terminal amino acid sequence was deduced from a partial cresidues. The VSA5 antion acid sequence was deduced from a partial open reading frame (ORF5) of a genomic locus (see AAV07179) of E. chaffeensis that was obtained on the basis of homology to the major antigenic protein MAP1 (see AAM51088) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar but non-identical proteins (see AAM07176-82) encoding a polypeptide (see AAM51088-99) that elicits a protective immune response against a rickettsial medicine, in vaccines to protect against Rickettsia Enrichia, medicine, in vaccines to protect against Rickettsia. Ehrlichia, analysma and Cowdria species. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies associated with Ehrlichia infection (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Barbet AF, Bowie MV, Ganta RR, Burridge MJ, Mahan SM, McGuire TC;

The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial
Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCMV) enhancer-promoter. Cowdria ruminatium genes designated map 2, hhworf1, 18hworf1 and 3fdorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This polypeptide comprises the major antigen protein I gene (MAPI) of Ehrlichia chaffeensis. It is encoded by the MAPI gene (see AAV01777). A claimed composition comprises a nucleic acid (see ARV07176-82) encoding a polypeptide (see AAW51088-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Ricketsia. Brilichia, Anaplasma and Cowdria species. The nucleic acid does not replicate in the host but remains episomal and capable of expressing polypeptide for at least 19 mth. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies associated with Ehrlichia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition containing nucleic acid encoding rickettsial antigen - useful for, e.g. stimulating protective immune response in humans or

New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettaial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures
                                               Major antigenic protein 1; MAP1; vaccine; immunogenic; rickettsia;
infection; heartwater; diagnostic.
                        Major antigenic protein 1 (MAP1) from Ehrlichia chaffeensis.
                                                                                                                                                                                                                                  Barbet AF, Ganta RR, McGuire TC, Burridge MJ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is given in a specification relating to nucleic acid vaccines containing genes to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsial as pp., Ehrlichia protective against the rickettsial pathogen. The vaccine comprises the protective against the rickettsial pathogen. The vaccine comprises the major antigenic protein 1 (MAP2) gene or the major antigenic protein 2 for the major antigenic protein and against the major and polypeptides are used in therapeutic and diagnostic applications. The infection by a rickettsial pathogen whilst the polypuclectides may be used to detecting antibodies associated with used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                               Ganta RR, Burridge MJ, Mahan SM, McGuire TC;

The sequence represents the amino acid sequence of major antigenic polypeptides are useful as vaccines for conferring immunity to rickettsia polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynuclectides may be used as molecular markers in nucleic acid pelanguis procedures, and to produce the MAP polypeptides, which may run and to produce the MAP polypeptides, which may rooplementary sequences within other nucleic acid molecules or dentify where such probes can be applied to identify or distinguish infectious research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The patent relates to homologous 28-kiloDalton (kDa) protein genes of Ehrlichia canis, designated ECa28SA1, ECa28SA3, ECa28SA3, ECa28SA3, ECa28SA3, ECa28SA3, ECa28SA2, ECA28SA3, ECA28SA2, ECA28SA3, ECA28SA3, ECA28SA2, ECA28SA3, ECA38SA3, ECA38SA3
of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAV06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homologous 28-kDa protein gene; ECa28SA3; immunoreactive; vaccine; p28 gene; polymorphic multiple gene family; immunoprotective antigen; antibacterial; canine ehrlichiosis; canine tropical pancytopaenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ehrlichia canis antigens useful for vaccinating against canine ehrlichiosis in dogs -
                                                                                                                                                                                                            Length 280;
                                                                                                                                                                                                                                                             Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              24..280

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to 2) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAY06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.

           The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafebensis and E. canis. The E. chafebensis proteins form part of the OMP family and consist of proteins OMP-1. -1(B to Z) shown in AAVG643-982 The E. canis proteins form part of the P30 family and consist of proteins shown in AAVG659-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the near full-length variable surface antigen VSA5 protein of Ehrlichia chaffeensis; it lacks about 5-7 C-terminal amino acid residues.

The VSA5 amino acid sequence was deduced from a partial open reading frame (ORF5) of a genomic locus (see AAV07179) of E. Chaffeensis that was obtained on the basis of homology to the major antigenic protein MAPI (see AAW51088) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar, but non-identical scene AAW51091-95). A claimed composition comprises a nucleic acid (see AAW51082) encoding a polypeptide (see AAW510899) that elicits a protective immune response against a rickettaial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, Ehrlichia,
                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition containing nucleic acid encoding rickettsial antigen - useful for, e.g. stimulating protective immune response in humans or

The present sequence shows a high degree of similarity to the major antigenic protein 1 (MAPI) of Ehrlichia sp. The MAPI gene may be used in a vaccines to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immuse response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HGWV) enhancer-promoter. Cowdria ruminatium genes designated map 2, Ihworf3, 4hworf1, 18hworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ganta RR, Burridge MJ, Mahan SM, McGuire TC; d AL, Simbi BH, Whitmire WW, Alleman AR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide comprises the major antigen protein I gene (MAPI) of Ehrlichia chaffeensis. It is encoded by the MAPI gene (see AAV07177).

A claimed composition comprises a nucleic acid (see PAV07176-82) encoding a polypeptide (see AAW31088-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia. Bhriichia, Anaplasma and Cowdria species. The nucleic acid does not replicate in the host but remains episomal and capable of expressing polypeptide for at least 19 mth. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies associated with Ehrlichia
                                                                                                                                                                                             MAP1 gene; major antigénic protein 1; rickettsia; DNA vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents the amino acid sequence of variable surface antigen 5 (VSA5) isolated from Ehrlichia chaffeensis, which has similarity to major antigen protein (MAP). The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The sequence represents the amino acid sequence of major antigenic protein i (MAPI) from Ehrlichia chaffeensis. The MAP polynucleotides and polyapetides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polyapetides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                    New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, as molecular markers in nucleic acid analysis procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             membrane protein; OMP; Ehrlichia chafeensis; E. canis; P30;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is given in a specification relating to nucleic acid vaccines containing genes to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Amaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The vaccine comprises the major antigenic protein 1 (MAP2) gene or the major antigenic protein 2 (MAP2) gene or the major antigenic protein 2 (MAP2) gene or the major antigenic protein 3 (MAP2) gene or the major antigenic protein 3 pathogens. The nucleic acid vaccines can be runninatium genes designated map 2, lhworfl, shworfl, 18hworfl and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypoptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polypucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens

                                                                                                                                                                                                                                                                ÷
                                                             The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAY06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ehrlichia chaffeensis. Its amino acid sequence was deduced from a partial open reading frame (ORF4) of a genomic locus (see AAV07179) of E. chaffeensis that was obtained on the basis of homology to the major antigenic protein MAPI (see AAW51088) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar, but mon-identical proteins (see AAW51091-95). A claimed composition comprises a nucleic acid (see AAV07105-82) encoding a polypeptide (see AAW51088-99) that elicits a protective immune response against a

diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCWV) enhancer-promoter. Cowdria ruminatium genes designated map 2, 1hworf3, 4hworf1, 18hworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TC;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens

The MAP polynuclectides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdia runnantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid manaysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial

                                                                                                                                                       The invention provides isolated outer membrane proteins (OMP) from brilionia chafeensis and E. Canis. The E. Chaffegenis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to 2) shown in AAVO6943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAVO6959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Outer membrane protein; OMP; Ehrlichia chafeensis; E. canis; P30; detection; dog.

                                                                                                                                          The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, ^{-1}(B to Z) shown in AAV06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAV06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.

These genes are members of a polymorphic multiple gene family and contained in a single locus of 5.52 kb. The 28-kDa proteins are immunoprotective with anti-E. canis serum hence are important immunoprotective antigens. The protein is useful for vacchating against E. canis infections such as canine ehrlichiosis in dogs. Canine ehrlichiosis, also known as canine tropical pancytopaenia, is a tick-borne rickettsial disease of dogs. ECa28-1 is conserved amongst different strains of E. canis and hence useful for serodiagnosis of canine ehrlichiosis. The present sequence is a E. canis ECa28SA3 30-kDa protein which is post-translationally modified to a
of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAYO6943-98B. The E. canis proteins form part of the P30 family and consist of proteins shown in AAYO6959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homologous 28-kDa protein gene; ECa28SA3; immunoreactive; vaccine; p28 gene; p0.0 ymorphic multiple gene family; immunoprotective antigen; antibacterial; canine ehrlichiosis; canine tropical pancytopaenia; tick-borne rickettsial disease; serodiagnosis.
